**Severe Asthma Unresponsive to Therapy as the
Initial Presentation of Pulmonary Venous
Drainage Obstruction**

5
To the Director,

6 **Q2** Pulmonary hypertension (PH) in patients with asthma is a rare
7 finding and often indicates the presence of additional comorbidities
8 [1].

9 A 53-year-old woman with no relevant past medical history
10 presented with new-onset exertional dyspnea. She was subse-
11 quently diagnosed with Scimitar syndrome during a cardiology
12 evaluation. This congenital anomaly is characterized by abnor-
13 mal drainage of the right pulmonary veins into the inferior vena
14 cava, an ostium secundum atrial septal defect, along with hypopla-
15 sia of the right lung. Surgical correction was performed using a
16 pericardial patch conduit to redirect the anomalous pulmonary
17 venous drainage to the left atrium through the atrial septal
18 defect.

19 Despite technically successful surgery, the patient continued to
20 experience exertional dyspnea, productive cough, wheezing and 1
21 exacerbation per year that required systemic corticosteroids, lead-
22 ing to suspicion of asthma. Since bronchodilation test came out
23 positive (increase in FEV₁ by 230 mL and 24% of pre-bronchodilator
24 value), inhaled corticosteroids plus long-acting beta 2 agonists
25 were started. Over time, symptoms and exacerbations decreased,
26 FEV₁ increased from 46% to 63% of the predicted value, with a neg-
ative bronchodilator test and low fractional exhaled nitric oxide

27 (15 ppb). However, dyspnea increased from mMRC grade 1 to grade
28 3 at the 10-year follow-up, being therefore referred to the special-
29 ized asthma clinic for further evaluation and management while
30 receiving triple inhaled therapy with high-dose inhaled corticos-
31 teroids.

32 Additional pulmonary function tests revealed mild restriction
33 (total lung capacity 77% of predicted value), severe diffusion
34 impairment (41% of predicted value) and oxygen desaturation from
35 93% to 84% during the 6-minute walk test.

36 Serial echocardiography demonstrated a progressive increase
37 in estimated systolic pulmonary arterial pressure (from 36 mmHg
38 to 54 mmHg in 4 years), with indirect signs of PH and no signifi-
39 cant intracardiac shunt. Right heart catheterization confirmed PH,
40 with mean pulmonary arterial pressure 34 mmHg, pulmonary vas-
41 cular resistance of 4.5 Wood Unit and pulmonary capillary wedge
42 pressure of 10 mmHg (left) and 19 mmHg (right), which are find-
43 ings consistent with group 1 PH [2]. Contrast-enhanced chest CT
44 scan demonstrated the complete occlusion of the right pulmonary
45 venous drainage (Fig. 1).

46 Scimitar syndrome is a rare and complex constellation of
47 cardiopulmonary anatomical abnormalities [3]. Its clinical pre-
48 sentation is heterogeneous and depends on the severity of the
49 anatomical abnormalities, the age at diagnosis and other exist-
50 ing congenital conditions [3]. In late onset presentation it is often
51 detected incidentally, either through unexplained right heart dil-
52 ation, recurrent pulmonary infections, or during the evaluation of
53 unexplained dyspnea [3]. PH commonly develops in patients with a
significant shunt [4]. Furthermore, between 16% and 33% of patients

Fig. 1. Contrast-enhanced chest CT scan demonstrating right pulmonary venous drainage correction through pericardial patch (first image) and its complete occlusion (second image). Red: left circulation; Blue: right circulation; Green: pericardial patch conduit connecting to the left atrium via the atrial septal defect.

54 who undergo surgical correction experience long-term drainage
55 obstruction [5].

56 In this patient, the suspected postoperative complication was
57 due to dyspnea disproportionate to the severity of her asthma and
58 the progressive development of indirect signs of PH. This case high-
59 lights the importance of performing additional research to rule out
60 other causes of dyspnea in patients with asthma and dispro-
61 portionate symptoms, such as PH.

62 CRediT authorship contribution statement

63 CSC, MJG and RMDC contributed to data acquisition, drafting
64 and manuscript review. All authors approved the final version of
65 the article.

66 Ethical considerations

67 we declare compliance with all ethical regulations. There were
68 no changes to standard clinical practice in this case.

69 Informed consent

70 informed consent given by the patient prior to publication.

71 Declaration of generative AI and AI-assisted technologies in 72 the writing process

73 The authors declare not to have used any artificial intelligence
tool.

74 Funding

75 None declared.

76 Conflicts of interest

77 None declared.
