improved inhibitors of the parent. Luckily, chemotherapies recommended for young patients were shown to improve the outcome. Herein, we report a case of 12-year-old boy with a locally advanced and metastatic NUT carcinoid arising in the mediastium.

NUT Midline Carcinoma in the Mediastinum

Ten-Year-Old Boy

were still in the early clinical trials. What should be altered is that target therapy with BET inhibitors could change the cytopathology and immunohistochemical features of the tumor cells and be deceivable in the estimation of tumor recurrence.

In summary, we present an unusual case of NMC in a Chinese boy. NMC should be considered in the differential diagnosis of any undifferentiated carcinoma. The rapidly exacerbated course without effective therapy makes the prognosis dismal. The establishment of The International NUT Midline Carcinoma Registry in 2010 promoted the international cooperation and the clinical trial of target therapy was conducted which may bring the light of hope to this kind of patients.
